Menu The app comes with a text interface that has to be used to navigate the menus of the app. To be more precise, you can set up all the settings through the Source Editor. The program also has a text interface, but it is a bit more difficult to make sense of. You should bear in mind that the interface of the application is not the same as the one from the program itself. For example, it is possible to set up the all the values using the Source Editor that appears when you press the OK button in the app interface, but it may not be the case if you want to set it in the app interface itself. The app interface There are a few variables in the interface that are configurable. Nevertheless, the primary setting is the base directory of the applications you compile. The second is the additional directory. The main advantage of this settings is that it gives you the ability to compile to numerous directories, but it also causes more problems in the interface. You should bear in mind that the tool is not aware of which directory it should use as the base for your compilation. It simply uses the source file that you specify to compile. That is why it is recommended that you set the directory that will be used as the base. Unfortunately, it may happen that you cannot place the directory you want to use for the base of the compilation. It means that you need to create one, however. The reason why we can do it in this way is that it is a lot easier to compile to the same directory as the project
